HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Figure S1. Biological plasma cell networks

Biological pathways encoded by the 202 unique plasma cell genes overexpressed in D7 PBs+D10 PCs+BMPCs compared to D0 MBCs+D4 actBCs were analyzed with Ingenuity software. Data are those of the highest score (67) network with 33 PC genes out of the 50 in the network. This network mainly comprises genes coding for proteins inducing *XBP1* expression or genes activated by *XBP1*. The networks are shown in supplemental Table 5.

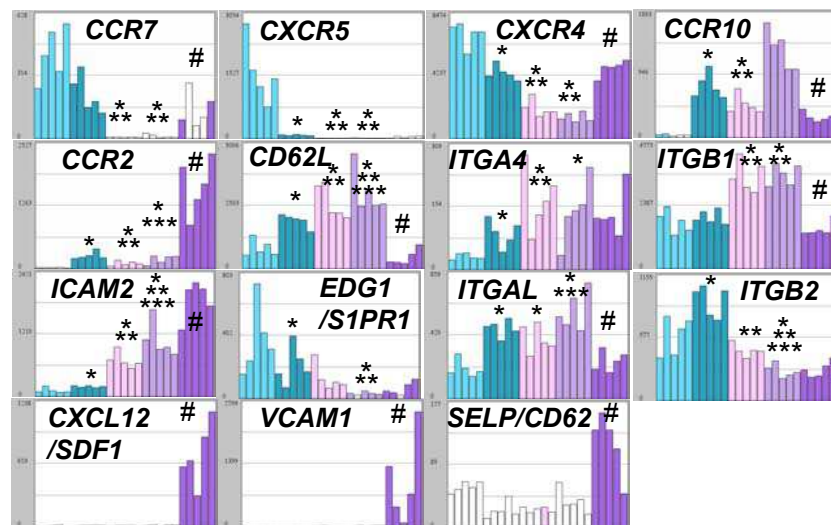

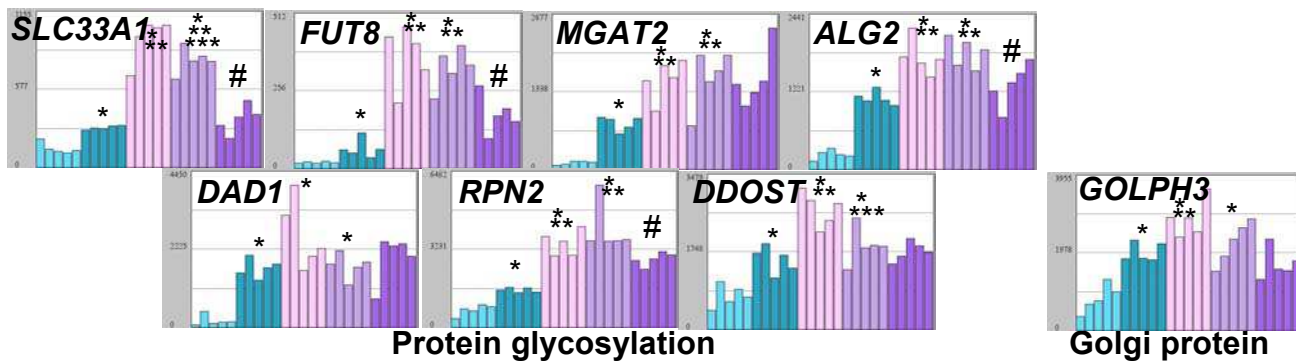

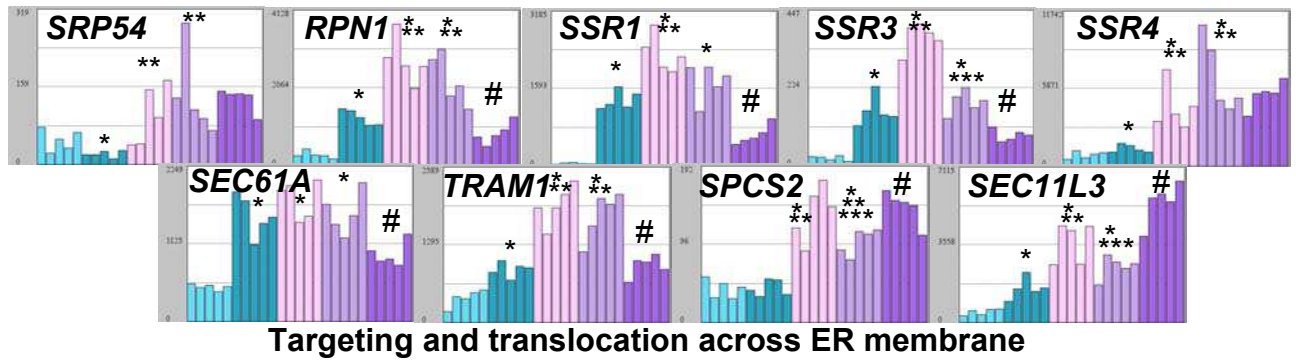

Figure S2. Visualization of gene expression using Amazonia “B cell to plasma cell Atlas”.

Data are the expression of genes coding for main B and PC markers (A) and homing molecules (B). * indicates that the mean expression is different from that in D0 MBCs, ** from that in D4 actBCs, *** from that in D7 PBs and # between D10PCs and BMPCs.

Table S1: B cell amplification and differentiation. Day 0-4. Step 1.

Purified memory B cells were cultured for 4 days using either sCD40L and/or ODN activation and various cytokine cocktails. At day 4, cell counts and viability were determined and cell phenotype was assayed with fluorochrome-conjugated anti-CD20, CD38, or CD138 mAb, or isotype-matched control mAb. Flow cytometry was performed with a FACScan device. Results are shown as the mean ± SD of n experiments. * indicates that the data are significantly different from those obtained in the sCD40L+ODN+IL-2+IL-10+IL-15 group ($P \leq .008$).

Table S2: Plasmablastic differentiation. Days 4-7. Step 2.

Purified memory B cells were cultured for 4 days in the various culture conditions as described in supplemental Table 1 and further cultured for 3 days with various cytokine combinations as indicated. At day 3 (day 7 of the whole culture), cell counts and viability were determined and the cell phenotype was assayed with fluorochrome-conjugated anti-CD20, CD38, or CD138 mAb, or isotype-matched control mAb. Flow cytometry was performed with a FACScan device. Results are shown as the mean ± SD of n experiments. * Indicates that the data are significantly different ($P \leq .04$) from those obtained in the sCD40L+ODN+IL-2+IL-6+IL-10+IL-15 group.

Table S3: Plasma cell differentiation. Day 7-10. Step 3.

Purified memory B cells were cultured for 4 days in the various culture conditions as described in supplemental Table 1 and then for 3 days as described in supplemental Table 2. At day 7, cells were cultured with IL-6+IL-15+IFN- α for 3 days and cell count and viability were determined. The cell phenotype was assayed with fluorochrome-conjugated anti-CD20, CD38, or CD138 mAb, or isotype-matched control mAb. Flow cytometry was performed with a FACScan device. Results are shown as the mean \pm SD of n experiments.
