

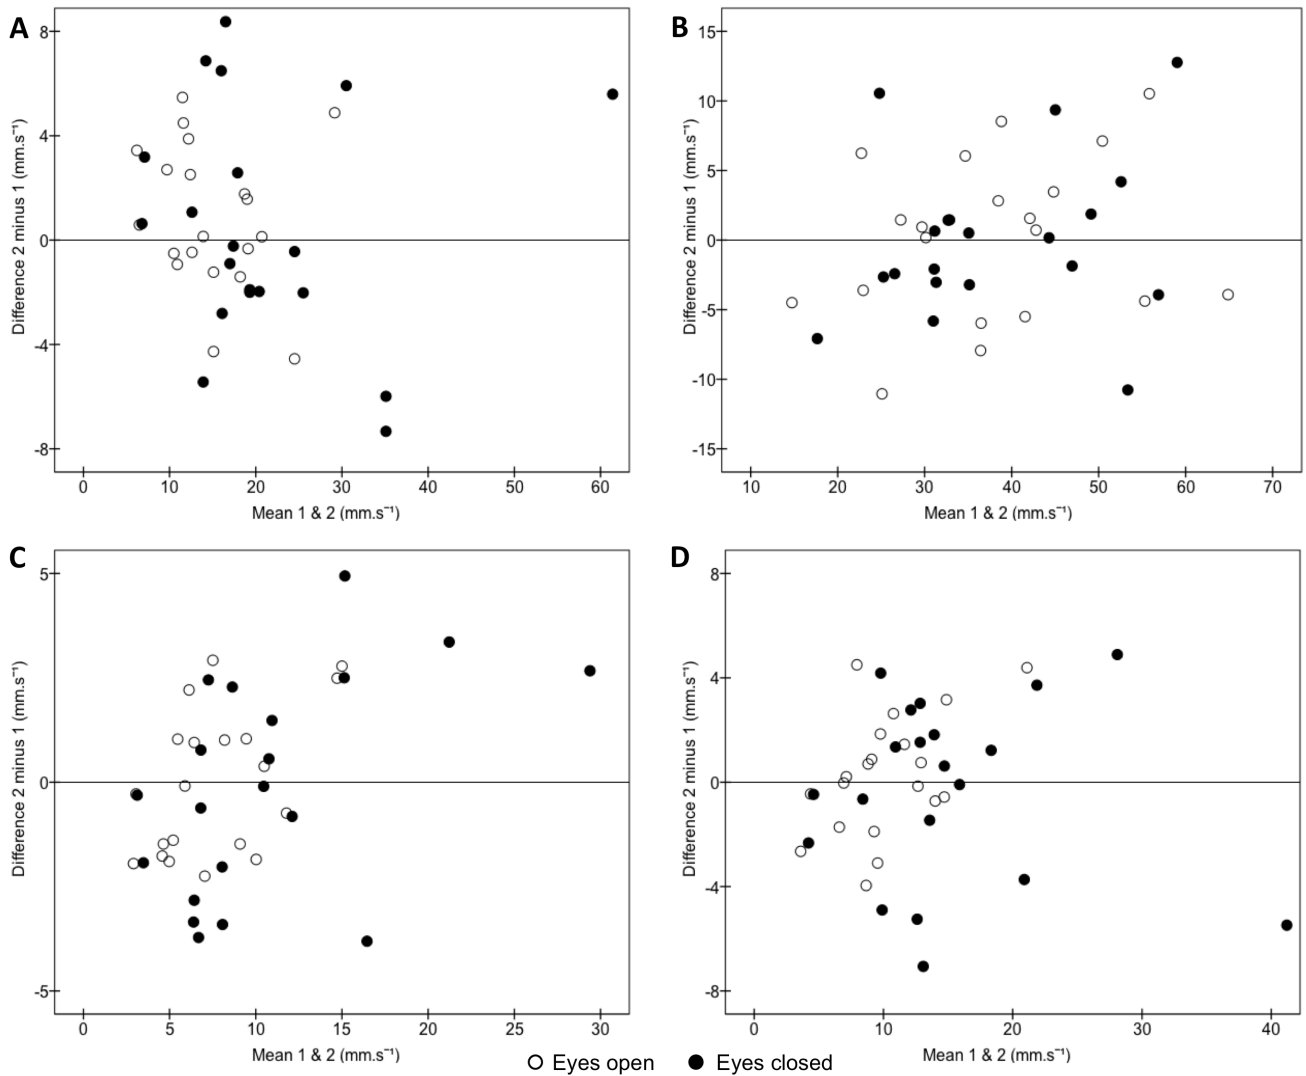

**Graphic illustrations of random error distribution for VEL (A),  $SD_{VEL}$  (B),  $VEL_{ML}$  (C) and  $VEL_{AP}$  (D), both in eyes open and eyes closed conditions.**

Random error (i.e. individual test-retest differences) is plotted against the individual means of the two sessions. For all variables, the random error is rather constant whatever the mean, which suggests absence of heteroscedasticity.
