## Abstract

$\beta$ -turn IV, *i.e.* the miscellaneous category, represents near 1/3<sup>rd</sup> of  $\beta$ -turn residues in protein structure, and is the second most frequent  $\beta$ -turn. An innovative clustering approach was able to underline the existence of different new turns not previously described. The four most occurring clusters defined the new  $\beta$ -turn types. They exhibit interesting sequence – structure relationships.

## Introduction

The classical secondary structures are composed of  $\alpha$ -helices and  $\beta$ -strands connected by coil. Two other repetitive structures also exist, namely the PolyProline II and the  $\beta$ -turns. These last have been characterized by a hydrogen bond between N-H and C=O of residues  $i$  and  $i+3$  by Venkatachalam<sup>1</sup>. He also characterized the first  $\beta$ -turn types. Later novel turns were defined, some being discarded, leading to a final collection of type I, I', II, II', IV, VIa1, VIa2, VIb, and VIII  $\beta$ -turns. Turns that do not fit any of the above criteria are classified as type IV<sup>2</sup>.  $\beta$ -turn IV, *i.e.* the miscellaneous category, represents near 1/3<sup>rd</sup> of  $\beta$ -turn residues in protein structure, and is the second most frequent  $\beta$ -turn. An automatic clustering approach based on the rules of  $\beta$ -turn type assignment was designed to search for recurrent new turns inside this miscellaneous type. A comparison with related studies and amino acid sequence over- and underrepresentation was performed underlying interesting features<sup>3</sup>.

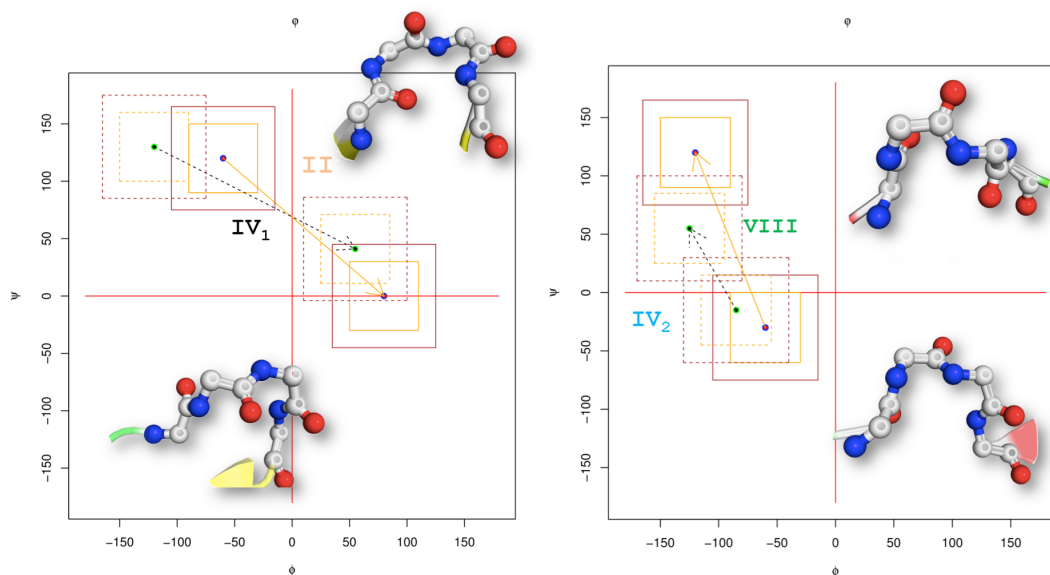

## Material & Methods

Different non-redundant dataset of protein structures were taken from low to higher redundancy to analyse potential bias of the dataset (none was found). From these datasets, were taken only the type IV  $\beta$ -turns encoded as their series of central dihedral angles.

A specific clustering approach was designed to cluster type IV  $\beta$ -turns by using the classical rule, allowing +/- 30° for all angles, with the exception of one at +/-45° for the defined values. The clustering derived from Self-Organizing Maps (SOM, without diffusion between the clusters)<sup>4</sup>. The training was carried out in 2 successive parts; the first one limited the potential bias of initialization,

and the second refined the clustering by using the specific rules for  $\beta$ -turn types. The type IV  $\beta$ -turns were selected from a dataset D. Thus, each dataset was associated with T type IV  $\beta$ -turns.

## Results & Conclusions

**FIGURE 1.**

Ramachandran plot of  $\beta$ -turns. (Left) a close-up of type II and  $IV_1$   $\beta$ -turns, and (right) on type VIII and  $IV_2$   $\beta$ -turns, the first square corresponds to the  $\pm 30^\circ$  rule, and the second one to the  $\pm 45^\circ$  rule.

Surprisingly, with 10 different datasets, the unsupervised training was highly robust, producing always the same four major clusters (with negligible variation). These types, named  $IV_1$ ,  $IV_2$ ,  $IV_3$  and  $IV_4$ , represent half of the type IV  $\beta$ -turns, and are more frequent than many established ones. Figure 1 shows a direct comparison of the two most frequent new turns with their closest relatives underlying their relationship but also their differences. Type  $IV_1$ , is in the neighbourhood of type II but with very different amino acid composition, while  $IV_2$  is close to type VIII with related amino acid content. Types  $IV_3$  and  $IV_4$  are in the same dihedral angle region than frequent  $\beta$ -turn type I, but with distinct dihedral angle values.

Comparisons with the previous alternative classification proposed by Efimov<sup>5</sup> and Thornton's group<sup>6</sup> emphasized the uniqueness of the approach. Notably, the most frequent new turn (type  $IV_1$   $\beta$ -turn) was not highlighted, although it is the 5<sup>th</sup> most occurring turn (including type  $IV_{\text{misc}}$   $\beta$ -turns (including rest of type IV  $\beta$ -turns)). Only the type  $IV_2$   $\beta$ -turns were previously included.
